

November 2019

Caves House was experiencing strong odour and improper function of our on site sewerage treatment plant (STP) due to a number of contributing factors, including the system not being able to handle the fats, oils and grease contained in the influent. This was having a very adverse affect on our hotel by impacting guest experiences and also causing large costs associated with trying to respond to the problems.

VHM Solutions were able to identify the contributing factors, offer a solution and incorporate HICLEAR technology to our systems which provided a cost effective, remediation solution that solved our issues by digesting the fats, oils and grease upstream prior to entering the STP.

By remediating existing infrastructure with minor construction works, and incorporating HICLEAR's biological technology, our plant is now able to cope with the influent and has returned to normal operating efficiency with a healthy bacterial environment within the STP. There is no odour on site and we have been able to significantly reduce the costs associated and the need to have the system regularly desludged and transported off site.

VHM Solutions worked in a safe manner onsite without impacting our operations or affecting our guests. The solution provided has allowed Caves House to continue to uphold its reputation as an Icon of Yallingup offering our clients and guests the best experience
